Tree-ring formation dynamics in *Fagus sylvatica* and *Quercus petraea* in a dry and a wet year

Supplementary Material

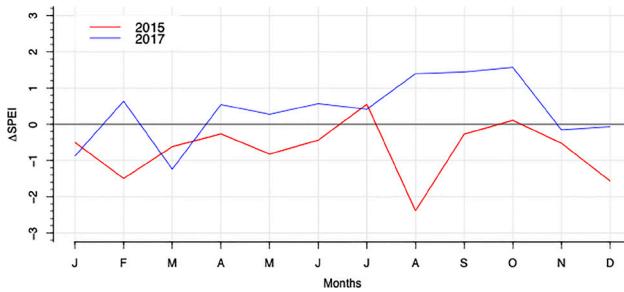

Fig. S1. Differences in SPEI in the years in which monitoring of cambium activity was conducted in oak and beech. Delta SPEI is the difference between the SPEI for 2015 and 2017, respectively, and the multi-year SPEI (1923–2019). The average SPEI value for 2015 was -0.682 , and for 2017 0.381 . According to the paired two-sided t-test for monthly values, the difference in averages was statistically significant ($t=3.03$, $p=0.011$)

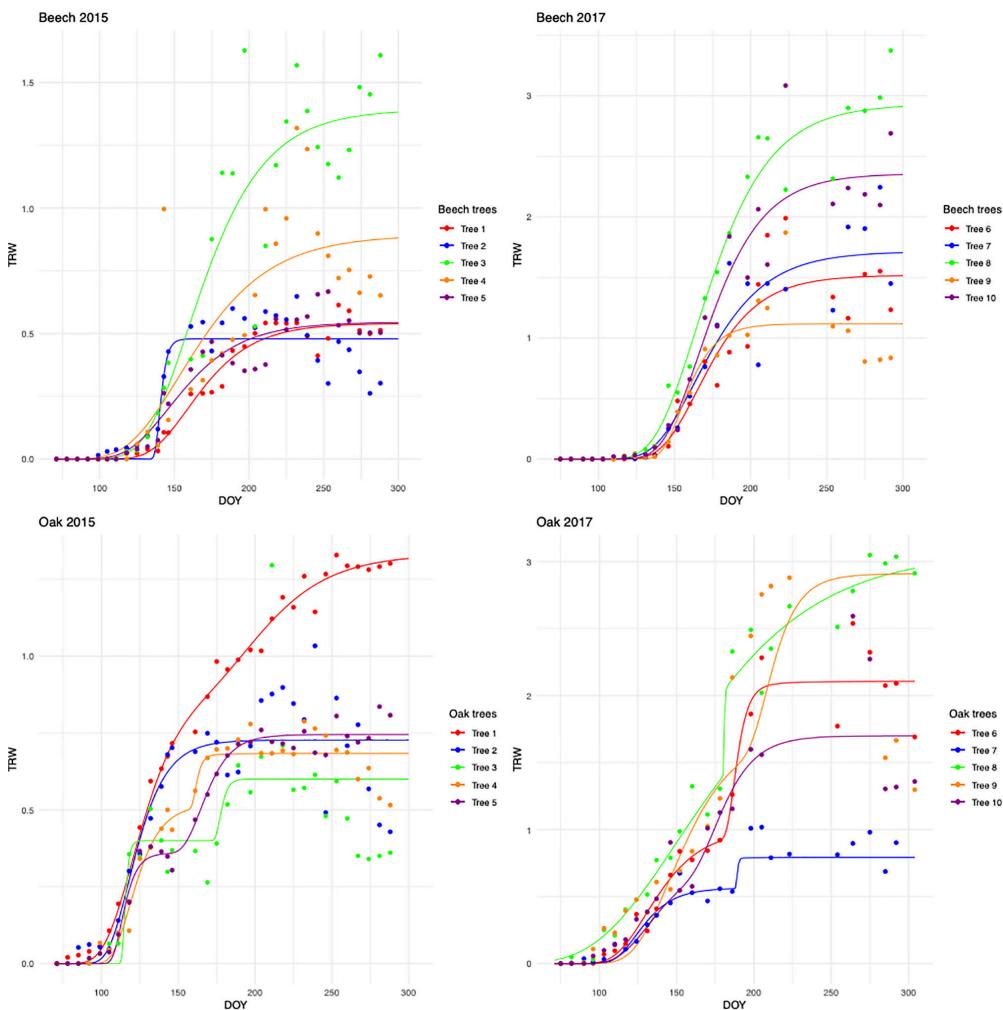

Fig. S2. Dynamics of annual growth in the individual trees studied. The curve for beech fit with the Gompertz function, and oak fit with the double Gompertz function

Table S1. Diameters at breast height (DBH) and parameters and statistics for the annual growth models for *F. sylvatica*. The height of the tree stand was 26 m and age about 63 (Forest Data Bank www.bdl.lasy.gov.pl/)
